"Bootstrapping an enterprise-wide knowledge management system using lightweight concept maps"

Bootstrapping of a knowledge management system (**KMS**) is a serious barrier preventing introducing and productive usage of KMS in enterprises. Using intuitive **concept maps** tools integrated into the user's working environment would help to solve the problem of KMS initialization and maintenance.

The task of this work is to extend and use the existing web-based concept map tool LeCoOnt to support bootstrapping and easy maintenance of an enterprise knowledge base.

Requirements:

- Good java programming skills

Preferable:

- Flex, Mozilla plugin programming
